

## # 2. Cumulative aggregate net crypto flows across geographies

**Seohyun Kim, 2023 / Python (matplotlib inline plotly and treemap)**

This chart was used in the Korean project on DeFi (Decentralised Finance) and FinTech in ASEAN to show the cumulative aggregate net cryptocurrency inflows across geographies during the first half of 2023. To make it easier to compare scales among the regions, I used a treemap with gradient colours. If the colour is darker, more inflows of cryptocurrency were transferred. During this time, USD 188.10 billion of flows to DeFi protocols occurred across geographies on-chain. This is from the forthcoming OECD publication, "The limits of DeFi for financial inclusion and the role of other FinTech applications: Lessons from ASEAN economies".
